

Code:

```
#include <stdio.h>
#include <stdlib.h>

// Structure to represent a record
struct Record {
    int recordNumber;
    char data[256]; // Adjust size if needed
};

int main()
{
    FILE *file;
    struct Record record;
    int recordNumber;

    // Open or create file (write mode)
    file = fopen("sequential_file.txt", "w");
    if (file == NULL)
    {
        printf("Error opening the file.\n");
        return 1;
    }

    // Write records
    printf("Enter records (Enter '0' as record number to exit):\n");

    while (1)
    {
        printf("Record Number: ");
        scanf("%d", &record.recordNumber);

        if (record.recordNumber == 0)
        {
            break;
        }

        printf("Data: ");
        scanf("%[^\n]", record.data);

        fwrite(&record, sizeof(struct Record), 1, file);
    }

    fclose(file);

    // Open file in read mode
    file = fopen("sequential_file.txt", "r");
    if (file == NULL)
    {
        printf("Error opening the file.\n");
        return 1;
    }

    // Read specific record
    while (1)
    {
        printf("Enter the record number to read (0 to exit): ");
        scanf("%d", &recordNumber);

        if (recordNumber == 0)
        {
            break;
        }

        while (fread(&record, sizeof(struct Record), 1, file))
        {
            printf("Record Number: %d\n", record.recordNumber);
            printf("Data: %s\n", record.data);

            if (record.recordNumber == recordNumber)
            {
                break;
            }
        }

        rewind(file); // Reset file pointer
    }

    fclose(file);
    return 0;
}
```

Output:
